**Quality Assurance Engineer**

In the past three years, Zoro has grown from a group of 6 people working out of a 2,000 square foot building, offering fewer than 100,000 products to a group of 100+ working out of a new 60,000+ square foot building, offering more than 400,000 unique products.

Since the launch of our successful e-commerce business, we have learned one thing-- developers aren't to be trusted, and we need a dedicated QA Engineer to help keep them in line.

We have assembled a collaborative group of 13 in our technology wing here, but this will be our first dedicated resource to ensure that our software is high-quality, bug-free, and ultimately makes our users happy.  The "chosen one" will support a variety of projects and take ownership of manually testing features as needed in addition to leading continuous integration & continuous deployment with rock-solid test automation tools.

We'll also appoint you our "voice of reason" for mitigating risk.

Those interested can forward a resume to bruce.simmons@zorotools.com

We believe this position will require some combination of the following:

- BS degree in Computer Science or a related field
- 3-5 years experience in quality assurance, preferably with public-facing web applications
- Experience with one or more automation tools, such as Selenium
- Experience working in agile or lean environments, and with continuous deployment
- Experience with BDD frameworks such as Cucumber a plus
- Experience with Python a plus
